

PLAIN ENGLISH AI GUIDE

AI Without The Tech Nonsense

A calm, practical guide for adults who want to understand AI, use it sensibly, and stop feeling behind.

This is for people who want a real starting point. Not jargon. Not hype. Just clear explanations, useful examples, and simple ways to get value from AI without handing over their judgement.

Introduction

AI is everywhere now, but that does not mean it has been explained well.

If you have felt unsure where to start, worried about trusting the wrong thing, or tired of being talked over by jargon, this guide is for you. You do not need to be technical. You do not need to understand everything. You only need a clear place to begin.

The aim is simple: help you choose the right tool, get one quick win, use AI for ordinary tasks, and know when to trust it and when to slow down.

What this guide will help you do

You will learn how to start with AI, how to get useful answers, how to use it for everyday tasks, and how to spot the moments when it should not be trusted.

What you will not need

You will not need tech knowledge, special software skills, or confidence with jargon. You will not need to understand how AI is built in order to use it well.

By the end of this guide, the goal is not to turn you into an expert. The goal is to help you feel calmer, clearer, and capable enough to use AI without feeling lost or silly.

Table of Contents

Use this to jump to the part you want first. You do not have to read it in order.

1. What Should I Use First?

Which AI tool to start with, and why ChatGPT is the easiest place to begin.

2. Your First Quick Win

A simple first task that makes the value obvious straight away.

3. What AI Actually Is

Plain-English explanation without the technical nonsense.

4. Where You're Already Seeing AI

How AI is already showing up in everyday life.

5. Why AI Feels So Confusing

Why this feels harder than it should, and why that is not your fault.

6. How To Get Useful Answers

How to ask for better results without needing prompt tricks.

7. Everyday Ways To Use AI

Simple uses that save time and reduce friction.

8. When AI Is Useful vs When It's Not

Clear boundaries so you know what AI is good for.

9. When NOT To Trust AI

The moments when a confident answer still needs checking.

10. What You Should Never Type Into AI

What to keep private and out of the tool completely.

11. How To Check AI Answers

A simple way to check what AI gives you before you act on it.

12. How To Spot AI-Made or Fake Content

Simple signs that help you pause before believing or sharing.

13. Quick Reference

A short reminder section for trust, safety, and starter prompts.

14. Closing Note

A calm finish that helps the reader feel settled, not overwhelmed.

1. What Should I Use First?

The first question is usually not, "How does AI work?" It is, "Which one should I use, and how do I begin without wasting time or feeling stupid?"

What is a prompt?

A prompt is simply the instruction or question you type into AI. It can be as short as "Summarise this" or as specific as "Rewrite this email so it sounds clear and polite."

If you are new, start with ChatGPT. That is the simplest place to learn the rhythm of using AI because it is built for asking questions, getting plain answers, and trying ordinary tasks like rewriting a message, summarising text, or helping you think through a small decision.

Once you understand one tool, the others make more sense. They are not separate worlds. They are different versions of the same basic idea, each with a slightly different strength. You do not need all of them on day one.

Why ChatGPT is the easiest place to begin

It feels the least intimidating for most beginners. You can type in a question, paste in a rough message, ask for a shorter version, or ask for help thinking something through. It is a good place to learn without pressure.

What ChatGPT is best for

Writing, rewriting, summarising, planning, comparing simple options, and turning messy thoughts into something clearer.

What ChatGPT is not best for

Private details, high-stakes decisions, anything that needs checking with a real source, or anything you would normally ask a professional about.

What the other tools are good at

Claude is often liked for long documents and careful reading. Gemini fits neatly into Google tools. Grok feels quicker and more conversational. Perplexity is useful when you want answers with links you can check.

How to download them

Start with the official app or website for each tool. Search carefully and choose the official result.

Here are the official places to begin:

ChatGPT

<https://chatgpt.com>

Claude

<https://claude.ai>

Gemini

<https://gemini.google.com>

Grok

<https://grok.com>

Perplexity

<https://www.perplexity.ai>

If you only want one place to begin, start with ChatGPT. Learn the basics there first. Once that feels normal, the other tools will make much more sense.

If you want the gentlest start

Use ChatGPT first. It is the cleanest way to practise asking and improving answers.

If you want sources and links

Try Perplexity later, once you are comfortable checking what AI gives you.

If you already live in Google tools

Gemini may feel convenient because it sits closer to the tools you already use.

If you work with long text

Claude can be a good later choice for reading, long writing, and careful editing.

The main point is not to choose the “best” AI. The point is to choose one that lets you start without friction, then build confidence from there.

2. Your First Quick Win

The fastest way to feel the value of AI is to use it on something small, ordinary, and useful. The goal is not to impress you. The goal is to make you think, "Right, I can actually use this."

A very good first win is turning a messy message into something clear, polite, and easy to send. It is simple, it gives an obvious result, and it teaches you how to use AI without putting anything serious at risk.

How to use this section

Open ChatGPT. Click into the text box where you would normally type. Paste one of the prompts below. If there is space for your own message, paste that in too. Then press send or enter.

What to expect

You are looking for a better draft, not a perfect final answer. Read it once, then ask again if you want it shorter, warmer, simpler, or more like your own voice.

Before you begin

Do not paste private details yet. Keep this practice simple. You are learning the shape of the tool first.

Prompt 1: make a message clearer

Copy this prompt:

Text to rewrite: [paste your message here]

Instruction: Rewrite this so it sounds clear and polite.

Worked example:

Text to rewrite: "I need the report tomorrow morning. If it is late again, this will be a problem."

Instruction: Rewrite this so it sounds clear and polite.

What a good reply might look like:

"Could you please send the report by tomorrow morning? It is important that it arrives on time, as we need it for the next step."

This is the easiest first task because the result is obvious. You will immediately see whether the answer is better than your first draft.

Prompt 2: shorten something long

Copy this prompt:

Text to summarise: [paste the message, article, or email here]

Instruction: Summarise this into three bullet points and tell me if there is anything I need to do next.

Worked example:

Text to summarise: "Your appointment has moved from Tuesday to Thursday. Please bring your ID and arrive ten minutes early."

Instruction: Summarise this into three bullet points and tell me if there is anything I need to do next.

What a good reply might look like:

- Your appointment is now on Thursday.
- Bring your ID.
- Arrive ten minutes early."

This is useful when something feels too long, too wordy, or too tiring to read properly.

Prompt 3: compare two choices

Copy this prompt:

Option 1: [paste option one here]

Option 2: [paste option two here]

Instruction: Compare these two options in plain English and tell me which one is better value for ordinary use.

Worked example:

Option 1: "💎9.99 a month, includes basic support"

Option 2: "💎12.99 a month, includes faster support and more features"

Instruction: Compare these two options in plain English and tell me which one is better value for ordinary use.

What a good reply might look like:

"Option 1 is cheaper and fine for ordinary use. Option 2 costs more, but you get quicker support and more features. If you only want the basics, Option 1 is better value."

This is useful for shopping, comparing services, or deciding between two practical choices.

How to improve the answer

If the answer is too long, ask for it shorter. If it sounds too formal, ask for warmer language. If it is not clear enough, ask it to try again in simpler words.

What you are learning here

You are learning the basic rhythm of using AI well: paste something in, ask clearly, read the answer, and improve it if needed.

If this one section helps you produce a better message, a shorter summary, or a clearer comparison, then the guide has already done real work for you.

3. What AI Actually Is

AI can sound big and mysterious, but in everyday life it is best understood as a tool that has seen a huge amount of information and can respond very quickly when you ask it to help.

It is not magic. It is not a person. It is not a mind with feelings or common sense. It is a system that has been trained to recognise patterns and produce useful responses when you ask it something.

A helpful way to picture it is this: AI is a very fast assistant. It can help you write, shorten, explain, organise, compare, and summarise. But it does not automatically know what is true, what matters most to you, or what you should do next. That part still belongs to you.

What AI is good at

It can help you make a rough idea clearer, turn long text into something shorter, suggest wording, and give you a quick starting point when you feel stuck.

What AI is not good at

It does not automatically know the truth, understand your life perfectly, or make important decisions for you. It can sound certain and still be wrong.

The simplest rule

Use AI for help, not as the final authority. Let it draft, sort, summarise, or compare, then use your own judgement for the final call.

The key lesson

AI is best understood as a fast-thinking, pattern-spotting tool that can make ordinary things easier. It can save time, reduce effort, and help you get started, but it should not replace your judgement.

Once you understand that, AI becomes much less mysterious. You stop expecting too much from it, and you also stop underusing it.

Use it when you want

A clearer version of something, a shorter version, help getting started, help thinking through a choice, or help making something easier to read.

Check it when the stakes are high

If something matters a lot, confirm it somewhere reliable before you act on it. AI can help you think, but it should not be the final authority.

4. Where You're Already Seeing AI, and Why It Feels So Confusing

AI is already showing up in the places you use every day, which is one reason it can feel confusing before you have even chosen to learn about it.

It may be in your phone, your search results, your email, your photo tools, your maps, the messages you receive, or the content people send you online. So this is not some distant subject for technical people. It is already part of ordinary life.

That is also why many people feel behind. AI did not arrive with a neat lesson first. It slipped into familiar tools, and only afterwards did people start acting as though everyone should already understand it. If that has made you uneasy, that is normal.

Where you may already notice it

A phone that suggests words, a search page that gives a summary, an app that helps write a reply, or an image online that looks a bit too polished or strange.

Why it can feel disorienting

Because AI is not waiting in one obvious place. It is spread across tools, websites, and messages, so you often run into it before anyone has explained it properly.

What not to assume

Do not assume everyone else understands it. Do not assume you are late. Do not assume the confusion means you are not capable of learning it.

The better way to think about it

AI is not a special club. It is a tool that is becoming part of normal life. Your job is not to know everything. Your job is to understand enough to use it wisely.

The mental model that helps most

Think of AI as a helper that can make things easier, but does not automatically know what is true or what matters most. It can save time, but it cannot replace your judgement.

That model is useful because it keeps both sides in view: the practical benefit and the need to stay thoughtful.

Example 1

A search result gives you a summary. Helpful, but still something to check if the answer matters.

Example 2

Your phone rewrites a message or suggests a reply. Useful for speed, but still your message to approve.

Example 3

An image or post looks real but feels slightly off. That is your cue to slow down instead of sharing it quickly.

Example 4

A tool offers to help you compare choices. Good for sorting. Not enough on its own for big decisions.

Why this matters

Once you see AI as something already woven into everyday life, the question changes. It is no longer, "What is all this?" It becomes, "How do I use it sensibly, and how do I know what to trust?"

5. How To Get Useful Answers

AI is usually most helpful when you tell it the job clearly. If the request is vague, the answer usually is too.

This is not about clever tricks. It is about giving the tool enough direction to do something useful. A lot of beginner frustration disappears once you know what to include in the request.

The simple formula

A good prompt usually has four parts:

- What you want help with.
- Why you need it.
- What kind of answer you want.
- How short, simple, or detailed you want it to be.

Think of it like giving directions to a helper. If you only say "help me with this," the tool has to guess. If you say what the task is, what it is for, and what shape you want the answer in, the reply is usually much better.

1. Start with the task

Say whether you want an explanation, a summary, a comparison, a rewrite, a plan, or ideas. The clearer the task, the better the answer.

2. Add a little context

Tell it who the answer is for or what it will be used for. That helps AI choose the right level of detail and tone.

3. Choose the format

Ask for bullet points, a short paragraph, step-by-step instructions, a table, or a simple explanation. Format keeps the answer from wandering.

4. Set the tone and length

If you want it warm, polite, simple, firm, or short, say so. Small instructions like this make a big difference.

What to do when the answer misses the mark

You do not need to start over. You can ask it to be shorter, simpler, warmer, or more direct. The first answer is often just a draft.

Helpful follow-up requests

Try asking for less detail, simpler language, or a more practical version. If the answer is too broad, say what part matters most.

Why this works

The tool is not guessing your thoughts. It is responding to the instructions you give it. Clear instructions usually mean better answers.

A good prompt shape

Task: [what you want help with]

Context: [who it is for / what it is for]

Format: [bullet points / short paragraph / table / steps]

Tone: [warm / polite / simple / firm]

Length: [short / medium / detailed]

The main lesson

The quality of the answer often depends on the quality of the request. Once you learn to be a little clearer, AI becomes much easier to use.

6. Everyday Ways To Use AI

This is where AI starts to feel properly useful. Not because it does something dramatic, but because it quietly takes some of the friction out of ordinary jobs you already do.

For many people, the real value of AI is not in the big impressive uses. It is in the small things that usually take too much effort, too much rereading, or too much mental energy. It helps when something feels dull, fiddly, confusing, or just a bit too much.

The best way to think about this section is simple: AI is a helper for everyday life. It can help you write more clearly, read more quickly, organise scattered thoughts, compare options, start something you have been putting off, and make a task feel lighter.

What it is for

Turning rough ideas into something useful, saving time on small jobs, and making ordinary tasks feel less tiring.

What it is not for

Replacing your judgement, making every decision for you, or handling private or high-stakes matters without checking.

The mental model

AI is most useful when the job is about starting, sorting, shortening, comparing, or making something easier to understand.

1. Writing emails

A lot of people spend far too long on emails that should have taken a minute. You know what you want to say, but the wording feels clumsy. AI can turn a rough draft into a clear, polite message without you having to wrestle with every sentence.

2. Summarising long messages, letters, and articles

Long messages are tiring. Long articles are tiring. Sometimes the hardest part is not understanding the topic. It is having enough energy to get to the end of it. AI can give you the main points first, so you know what matters.

3. Comparing options before you spend money

Buying something often becomes stressful when the choice is unclear. AI can help lay the options out in plain English so you can see what matters for ordinary use instead of getting lost in marketing language.

4. Planning something without the mental clutter

A day trip, a meal plan, a visit, a shopping list, a rough timetable. AI can turn a half-formed idea into something more organised and easier to act on.

5. Thinking through a decision

Sometimes you do not want AI to choose for you. You want it to help you think. It can help you look at pros and cons, spot what you may be missing, and organise a half-formed thought.

6. Making notes and rough thoughts easier to use

If you have scattered notes, half-written plans, or a list that is hard to follow, AI can tidy the shape of it so you have something usable to work from.

7. Helping with forms, admin, and paperwork

A lot of everyday admin is not difficult. It is just irritating. AI can make wording clearer, explain what a form is asking, or help draft a reply without making the task feel so heavy.

8. Reading unfamiliar things in plain English

If something feels technical or full of jargon, AI can translate it into normal language so you can understand the point without wrestling with the wording.

9. Writing in the right tone

Sometimes the words are right, but the tone is off. AI can make something warmer, more polite, shorter, more direct, or easier to understand without changing the meaning.

10. Getting started when you feel stuck

Sometimes the problem is not the task itself. It is starting. AI can help you turn a blank page into a rough first draft, which is often enough to get you moving again.

What to remember

AI is often most useful in ordinary life, not extraordinary life. It is there for the little jobs, the fiddly jobs, the annoying jobs, and the jobs that become easier when you do not have to do all the thinking from scratch.

That is where the value is. Not in making you faster in a flashy way, but in making normal life feel a little lighter, a little clearer, and a little easier to handle.

7. A Small Step Into More Advanced Tools

Once the basics feel normal, there are three more things worth knowing about: image generation, web search, and deep research.

You do not need these first. But it helps to understand what they are for, because they solve different problems. Image generation is for making something visual. Web search is for checking current information. Deep research is for going further and pulling together a fuller answer from more than one source.

Image generation

This is the playful one. You describe a picture, and ChatGPT makes the image for you. It is useful when you want something visual, something funny, or something that helps you picture an idea.

Web search

This is for checking what is current. If you want live information, recent updates, current prices, or something you can verify, search is better than guessing.

Deep research

This is for bigger questions. It reads more, compares more, and gives you a fuller answer when a quick reply is not enough.

The simple rule

Use image generation when you want to make something visual, web search when you want something current, and deep research when you want something more complete.

How to use image generation in ChatGPT

Open ChatGPT, choose **Create image** from the tools menu, and type what you want to see. The best prompts for this audience should feel familiar, gently funny, or emotionally easy to recognise.

Try this image prompt

Create a cosy living room scene where an older person is calmly teaching a confused robot how to make a proper cup of tea. Warm, funny, gentle, and welcoming.

Try this image prompt

Make a friendly illustration of a woman in her 60s looking pleased because AI finally explained something in plain English.

How to use web search in ChatGPT

Open ChatGPT, choose **Search** from the tools menu, and ask for something current that you can check. This is useful when you want live information instead of a guess.

Web search is helpful for products, current updates, official pages, prices, opening hours, or anything that changes over time.

Try this web search prompt

Search the web for the best current beginner-friendly AI tool for writing and give me a simple summary.

Try this web search prompt

Find the official pages for ChatGPT, Claude, Gemini, Grok, and Perplexity and tell me what each one is best for.

How to use deep research in ChatGPT

Open ChatGPT, choose **Deep research** from the tools menu, or type **/Deepresearch**. Then write what you want to learn. Deep research is for bigger questions that need more reading, more comparison, and a fuller answer.

It is useful when you want a proper summary of a fast-moving topic, when several sources matter, or when you want a structured report rather than a quick reply.

Try this deep research prompt

Use deep research to summarise the most important AI updates from May 2026 in plain English.

Try this deep research prompt

Research the recent changes in AI and tell me what a beginner should pay attention to, without technical language.

The big picture

Image generation helps you make something. Web search helps you check something. Deep research helps you understand something properly.

You do not need all three at once. You only need to know what each one is for and when it becomes useful.

8. When AI Is Useful vs When It's Not

AI is not equally useful for everything. That is an important thing to understand early, because a lot of disappointment comes from asking it to do jobs it was never really meant to do.

AI is best when the task is about helping you think, shape, sort, simplify, or start. It is very good at turning rough notes into something clearer, shortening long text, rewriting messages, comparing simple choices, explaining things in plain English, and helping you get started when you feel stuck.

That is where it shines. It can take a messy thing and make it more usable. It can take a long thing and make it shorter. It can take a blank page and give you a starting point. That is useful because many ordinary tasks are not hard in a deep sense. They are just annoying, tiring, or hard to begin.

Useful for

Writing emails, summarising text, comparing simple options, organising notes, planning small tasks, and helping you think something through.

Less useful for

Jobs where truth, judgement, risk, or responsibility matter more than speed or convenience.

When AI is not the right tool

AI is less useful when the job depends on truth, judgement, risk, or responsibility. That is where people need to slow down.

If you want help writing an email, AI can be brilliant. If you want help deciding between two options, AI can help. If you want to turn a rough thought into something clear, AI can help. But if the answer really matters, you should not let AI be the final authority.

Be careful with

Money, health, legal issues, safety, private information, and anything where a wrong answer would cause real trouble.

Why caution matters

AI can sound very sure of itself. It writes in full sentences and gives neat explanations. That does not mean it is correct.

When NOT to trust AI

If the answer is about something important, check it. If the answer sounds smooth but you are not sure, check it. If the answer could affect health, money, safety, or a major decision, do not rely on AI alone.

A polished answer is not the same as a correct answer. A nice-looking summary can still miss the point. A confident reply can still be wrong.

Low-risk tasks

Writing, rewriting, summarising, organising, and comparing simple options are good places to treat the answer as a draft.

Higher-risk tasks

Health, money, legal matters, and anything that could cause harm if wrong should be checked somewhere reliable before you act.

The simple rule

Use AI for help, not as the final authority. Let it draft, sort, simplify, or compare, then use your own judgement for the final call.

The real skill is not learning to trust everything it says. It is learning when it is giving you something useful, and when it is only giving you something that sounds useful.

9. How To Check AI Answers

AI can be useful, but it should not be treated like a final authority.

That is why this part matters.

A good answer from AI can still be incomplete, outdated, or just plain wrong. Sometimes it sounds smooth enough that you stop questioning it. That is exactly when a simple checking habit helps most.

You do not need a complicated system. You need a calm, repeatable way to decide whether the answer is good enough to use.

The easiest framework is this:

1. Read the answer once without acting on it

Do not rush. Just read it through and ask yourself one simple question:

Does this actually answer what I asked?

If it does not, do not assume that is your fault. It may simply mean the prompt was too vague, or the answer was too broad.

2. Separate useful from uncertain

A lot of AI answers contain a mix of both.

Some parts may be helpful. Some parts may be obvious. Some parts may be guesswork.

So look for the parts that feel concrete and the parts that feel shaky.

Useful signs

- it gives a clear summary - it uses plain language - it follows your request - it stays on topic - it gives you something you can use

Uncertain signs

- it sounds confident but says very little - it adds details you did not ask for - it makes claims without explaining them - it feels vague, generic, or overly polished - it seems to be filling in gaps with guesses

If a response feels a bit too neat, that is a reason to slow down, not speed up.

3. Check anything that matters

If the answer is about something low-risk, like wording, a summary, or a rough plan, you can often use it as a draft and move on.

If the answer is about something more important, check it.

That includes:

- prices - dates - names - locations - advice that could affect money, health, safety, or important decisions - anything you would feel foolish or upset about if it turned out to be wrong

A simple rule: If it would matter to you or someone else, verify it.

4. Ask AI to check itself

This is one of the most useful habits you can learn.

You do not have to start over. You can ask the AI to slow down and review its own answer.

Try prompts like:

- Check your last answer for anything uncertain or possibly wrong. - Show me which parts of this answer are solid and which parts should be checked. - List any claims in your answer that might need verification. - What would you double-check before using this? - Is there anything here that sounds confident but may not be fully reliable?

This is helpful because it forces the tool to separate its best guess from its firmer points.

5. Compare it with a reliable source if it matters

If the answer is important, do not rely on AI alone.

Use a trustworthy source:

- an official website - a direct document - a proper news source - a company help page - a professional source you already trust

You are not trying to become suspicious of everything. You are just making sure the answer stands up when it matters.

6. Decide what kind of answer you have

This is the part most people skip.

Not every AI answer should be treated the same way.

Some answers are:

- a draft - a summary - a starting point - a suggestion - a rough comparison

Some answers are:

- factual claims - advice - instructions - details that need checking

If it is a draft, you can usually improve it. If it is a fact, you should verify it. If it is advice, you should think before acting on it.

That one distinction will save you a lot of confusion.

7. Use a simple final test

Before you trust the answer, ask yourself:

- Does this make sense? - Did it actually answer my question? - Is anything here too vague? - Is there anything important missing? - Would I be comfortable acting on this without checking?

If the answer feels clear, useful, and low-risk, it may be good enough. If it feels uncertain, it probably needs another look.

A very simple version of the framework

If you want the short version, use this:

- Read it - Notice what feels certain and uncertain - Check anything important -
- Ask AI to review its own answer - Compare it with a reliable source if needed -
- Treat drafts as drafts, not facts

That is enough for most everyday use.

The goal is not to doubt everything. The goal is to build a habit where AI helps you move faster without making you careless.

Once you learn that balance, AI becomes much more useful.

10. How To Spot AI-Made or Fake Content

The safest way to think about suspicious content is not, "Can I spot every fake?" It is, "What is the fastest sensible way to check whether this is real before I believe it or share it?"

That matters because fake content is often designed to look ordinary. It may arrive as an email, a private message, a photo, or a news-style post. The trick is not to become paranoid. The trick is to learn a few simple checks that work in everyday life.

A helpful extra check

If you are not sure about an image, you can also use an online detection tool to get a second opinion. One example is Sightengine's AI image detector:

<https://sightengine.com/detect-ai-generated-images>.

It is not perfect, but it can be a useful extra check when something looks suspicious and you want another clue before you trust it.

Use it as one piece of evidence, not the final answer.

For emails

Start with the sender. If an email says it is from a bank, delivery company, government office, or service you use, check the actual email address. If the sender does not match the real organisation, treat it as suspicious.

That is often the clearest sign of a scam.

Also be careful if the email creates panic, says you must act immediately, asks you to click a link or send money, or asks for passwords, bank details, or private information.

For Facebook messages and other social messages

Be especially cautious with random messages from people you do not know. If a stranger sends an urgent message, asks for money, claims something has happened, or tries to pull you into action quickly, assume it is a scam until proven otherwise.

Check the account

If it is pretending to be someone you know, check whether the account is real. Look at the profile carefully. If the account looks new, empty, odd, or slightly off, do not rush to respond.

For photos

Use an online image checker as your first extra step. If a photo looks suspicious, upload or check it there first.

Good places to start are: [Sightengine AI image detector](#) and [Content Credentials Verify](#).

Then look at the image itself. Do hands or faces look strange? Does the text in the image look odd? Do shadows, reflections, or edges seem off? Does it look too smooth or too polished?

If the photo is being used to make a dramatic point, check the story around it too. Sometimes the image is only there to make the claim feel more believable.

For news

Do not trust the first headline you see. If something feels surprising, upsetting, or too convenient, use web search to check whether other reliable sources are reporting the same thing.

Use this prompt

News story to check: [paste the story or headline here]

Prompt: Search the web for this news story and tell me whether it is likely true or false. Give me the main facts from reliable sources in plain English.

More news prompts

Claim to check: [paste the claim here]

Prompt: Check whether this claim is being reported by other trustworthy sources.

Another useful prompt

Story to follow up: [paste the story or topic here]

Prompt: Search for the latest updates on this story and tell me what is confirmed, what is uncertain, and what has been exaggerated.

The simple beginner rule

For emails: check the sender.

For social messages: check whether the account is really who it claims to be.

For photos: use Sightengine first, then look for strange details.

For news: use web search to confirm the story with reliable sources.

One final reminder

If it creates urgency, pressure, or confusion, slow down. You do not need to catch every fake by eye. You just need a few reliable habits that help you pause before you believe, click, or share.

11. Closing Note

AI is not coming. It is already here.

You see it in your phone. You see it in your search results. You see it in messages, photos, articles, and the tools people use every day. That is why this guide was never meant to turn you into an expert. It was meant to give you a clear starting point, so AI feels less mysterious and more usable.

If this guide has done its job, then you should now have a better sense of what AI is good for, what it is not good for, how to ask it for help, when to trust it, when to slow down, and how to stay safer online.

That is enough.

You do not need to know everything. You do not need to use every tool. You do not need to sound technical or keep up with every headline.

You only need enough understanding to make sensible choices, use AI in ordinary life, and avoid the obvious mistakes that catch people out.

That is what this guide was built for.

I wrote it because I have helped people in my own family make sense of AI, and I know how frustrating it can feel when something is everywhere but never properly explained. A lot of people do not need more noise. They need something calm, plain, and practical that respects where they are starting from.

If you have felt behind, confused, or unsure whether this whole thing is really for you, I hope this guide has taken some of that pressure off.

You do not have to master AI. You just have to understand it well enough to use it with confidence.

And now you do.
